
Psychosocial Analytics

A classic iOS case management companion for social workers and community workers.

Built for structured psychosocial assessment, routine data entry, AI-assisted report drafting, risk visibility, analytics, and continuity of care.

Made for frontline practice

Psychosocial Analytics turns scattered notes into organized assessment evidence.

The app is designed around the daily pressure of field visits, interviews, follow-ups, service referrals, supervisor reviews, and documentation deadlines.

Dashboard Command Center

Start the day with caseload, drafts, signed reports, flagged assessments, AI queue, and cloud status visible at a glance.

The dashboard reduces the need to jump between tools just to know what needs attention next.

Guided Assessment Entry

Structured templates guide social history, functioning, presenting concerns, strengths, needs, and recommendations.

Guided Assessment Entry

Structured sections, required fields, prompts, dates, choices, and long-form notes for consistent intake.

iOS assessment

- Client profile
- Presenting needs
- Strengths and assets
- Risks and follow-up

Structured entry
Prompts, fields, review

Risk visibility
Source-linked notes

Draft report
Human reviewed AI draft

Case follow-up
Goals and interventions

Ready for review

Prompts and required fields improve consistency while still leaving space for professional narrative judgement.

Routine Data Entry

Short text, long text, dates, numbers, and choice fields keep daily documentation predictable.

Guided Assessment Entry

Structured sections, required fields, prompts, dates, choices, and long-form notes for consistent intake.

iOS assessment

- Client profile
- Presenting needs
- Strengths and assets
- Risks and follow-up

Structured entry
Prompts, fields, review

Risk visibility
Source-linked notes

Draft report
Human reviewed AI draft

Case follow-up
Goals and interventions

Ready for review

Workers can record information in the shape that fits the evidence instead of forcing every detail into a single note field.

Safeguarding Visibility

Risk flags and safeguarding notes are elevated with source context.

Important safety indicators become visible earlier, supporting faster supervision, escalation, and follow-up decisions.

AI Draft Report Review

The app generates draft reports from structured assessment data while preserving human review as a professional requirement.

Every AI-generated paragraph remains draft material until reviewed, corrected, and signed by the worker or clinician.

Goals and Recommendations

Goal planning, recommended interventions, plan for intervention, and follow-up planning are organized into a coherent report section.

This helps workers move from assessment to action without losing the thread between needs, strengths, and next steps.

Analytics

Status breakdowns and trend analytics support reflective practice and service management.

Completion velocity, risk frequency, and review turnaround can guide workload conversations and program improvement.

Cloud Continuity

CloudKit sync and iCloud backup recovery support continuity when work moves between office, field, and follow-up settings.

The app is designed for modern iOS workflows where documentation must remain accessible and recoverable.

Secure Provider Settings

AI provider configuration, endpoint visibility, model selection, and Keychain API-key storage keep setup transparent.

Teams can understand what engine is being used and preserve security expectations around credentials.

Case Management Timeline

A case can move from intake to assessment, review, goals, recommendations, follow-up, and report preparation in one professional workflow.

This gives social workers and community workers a stronger case record without multiplying admin burden.

Professional Documentation Output

Reports gather basic information, background and functioning, clinical summary, diagnostic impressions, risk notes, missing information, and recommendations.

The result is a review-ready draft that saves time while still respecting professional accountability.

What makes it different

It combines structured psychosocial assessment, guided field entry, risk visibility, AI-assisted drafting, analytics, and continuity settings inside one iOS-native experience.

Many tools handle notes or reports. Psychosocial Analytics connects assessment evidence to report language and case management flow.

Less admin, stronger judgement

The app gives practitioners a calmer documentation path so professional reasoning can stay central.

Instead of rebuilding every report from scratch, workers can review, refine, and sign a draft grounded in the assessment record.

Designed for practical field work

Community workers need fast, clear, repeatable documentation that supports continuity across visits and referrals.

Structured prompts reduce missing information and help preserve the lived context behind each case.

Better assessment discipline

Required fields, section completion counts, and prompts make the assessment process easier to audit and easier to finish.

Teams gain a shared structure without erasing the nuance of each client story.

Better follow-through

Risk notes, missing information, goals, plans, and follow-up tasks become visible parts of the same case picture.

That improves handover, supervision, review, and professional accountability.

Built for responsible AI use

The app treats AI as a drafting assistant, not a substitute for professional decision-making.

Human review before signature or export is embedded in the product story and visible in the report experience.

Psychosocial Analytics for iOS

A classic, practical, and elegant tool for assessment, reporting, and case management.

For teams that want documentation to be faster, clearer, safer, and more professionally useful.
